

AMENDMENTS TO THE SPECIFICATION

Please replace the paragraph beginning at page 2, line 1 with the following amended paragraph:

However, since polyester composed of such a diol component has a ~~r-latively~~relatively large coefficient of friction and poor mechanical strength (that is, poor resistance to mechanical stress), obtained toner particles are liable to be fractured in a developing device, thus resulting in a case that problems such as poor electrification, contamination of the device, lowering in a fixing property, and the like occur.

Please replace the paragraph bridging pages 76 and 77 with the following amended paragraph:

In a main body 20 of the image forming apparatus 10, an image carrier 30 composed from a photoreceptor drum is arranged, and it is driven to be rotated in the direction indicated by the arrow by a drive means not shown. In the circumference of the image carrier ~~carri-~~carrier 30, along its rotating direction, there are disposed a charging device (charger) 40 for uniformly electrifying the image carrier (photoreceptor) 30, an exposure device 50 for forming an electrostatic latent image on the image carrier 30, a rotary developing device 60 for developing the electrostatic latent image, and an intermediate transfer device 70 for primary transfer of a monochromatic toner image formed on the image carrier 30.

Please replace the 2nd paragraph on page 65 with the following amended paragraph:

Such an external additive can be added by mixing with the powder for manufacturing a toner, using a Henschel-HENSCHEL mixer, for example.

Please replace the first full paragraph on page 102 with the following amended paragraph:

These components were mixed using a 20 liter type Henschel-HENSCHEL mixer to obtain a material for manufacturing a toner.

Please replace the paragraph bridging pages 103 and 104 with the following amended paragraph:

Thereafter, 100 parts by weight of the toner particles which have been subjected to the thermal spherizing treatment and 2.5 parts by weight of an external additive were mixed using a 20 liter type Henschel-HENSCHEL mixer, to thereby obtain a toner. The used external additive was a mixture containing 1 part by weight of negatively-chargeable silica with relatively small grain size (average grain size: 12 nm), 0.5 part by weight of negatively-chargeable silica with relatively large grain size (average grain size: 40 nm), and 1 part by weight of rutile-anatase type titanium oxide (having a nearly fusiform shape and an average major axial diameter of 30 nm). In this connection, the used negatively-chargeable silica (negatively-chargeable silica with relatively small grain size and negatively-chargeable silica with relatively large grain size) was silica which has been subjected to a surface treatment (hydrophobic

treatment) with hexamethyl disilazane. Further, the used rutile-anatase type titanium oxide was a mixture of rutile type titanium oxide and anatase type titanium oxide in a ratio of 90:10, which absorbs light in the wavelength region of 300 to 350 nm.

Please insert the following Tables 1 and 2 into the specification on page 109 after the fourth full paragraph:

TABLE 1

Amorphous PES	Kind	Content (pts.wt)	Block PES		Other PES		Coloring agent		CCA		Wax		External additives			
			Kind	Content (pts.wt)	Kind	Content (pts.wt)	Kind	Content (pts.wt)	Kind	Content (pts.wt)	Kind	Content (pts.wt)	Rutile-anatase type titanium oxide	Silica with relatively small size	Silica with relatively large size	Positively-charged silica
